

Stern / Sega Power Tap Installation

The Stern / Sega Power Tap is designed to fit in many Stern built games. While Stern power supplies are all a little different, the power connector is the same.

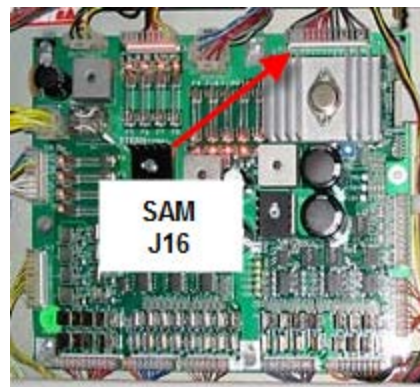

Installation Instructions

1. Locate the 15 pin power connector. It is labeled J16 on the power supply.
2. Remove the 15 pin power connector.
3. Install the Power Tap onto the power supply. The connector is keyed so there is only one way to install the power tap. The 12v/5v power connector on the power tap will face upward in the cabinet. The connection will be stiff, use steady pressure but DO NOT force the connection!
4. Once the board is installed, verify that you have plugged it in correctly, and then connect the games 15 pin power connector to the 15 connector on the power tap.

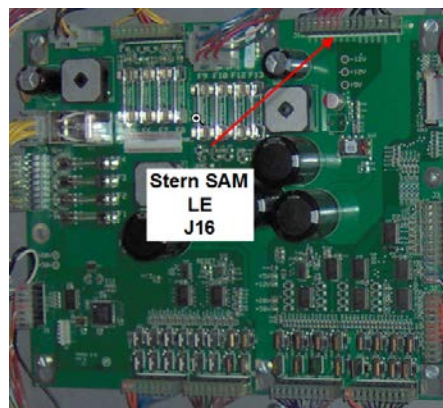

Now you can connect your mods to the power supply using the power tap. Wire cutting is not necessary!
